

The update to Build 4

Posted by jcase469 - 03 Sep 2011 23:06

Since nobody else has said anything, I wanted to say thanks for the quick update to support Uniden's new firmware update for the HP-1.

Also, if anyone is interested, I still use an AOR-8000 scanner (I have 3 of them) and the ARC8000 software is still going strong for me with no problems at all after all of these years. I just wish I had something as good for my AOR-3000A which I also still use.

Perhaps the reason there have not been many comments about build 4 is there doesn't seem to be any documentation that states what the changes are...the manual link does NOT mention build 4 on the changes page at the end of the manual.

Build 4 supports the new delays.

ARC8000/AR8000 those were the days, I'm surprised your remote cable survived those years, whoever invented that :-)
