

"Private Calls"

Posted by x9t27 - 21 Jan 2012 19:58

When using the wildcard "i0" talkgroup in a moto 2 system, why does the alphas read "unknown"; even though I assigned the words

"Private Call" to the talkgroup? I have my suspicions but would like to hear from others that are more "In-The-Know" than I.

Also, really wish that the UID-2 function would stay "ON" after powering off... Please?!?!

I would suspect that the HP is trying to use the defined UID for the radio involved in the Private Call and is not looking at the i0 talkgroup definition.
