

ARC Patrol 2.03

Posted by ARC PATROL - 08 Jun 2012 23:54

Arc Patrol V2.03 is now available.

The virtual control now supports logging of UIDs and unknown talkgroups. Plus data can now be stored in a csv file. UID logging still needs some tweaking but works.

Another new feature is the RadioReference search option and AP is the first ARC software package that can do this, you can now search the RR database for information about an unknown frequency. Option is available in the Tools menu and you can also trigger a search by double clicking a grid line in the VC log grid. You do need a premium RR subscription to use the search option. You can search a maximum of 3 different US States.

It must be getting too late at night as I am making mistakes, I have it correct now...

The Virtual screen is now mimicking the actual HP.

That is, the VC shows Unknown [Orange] and TG:1234 [Yellow large font] the same as the real HP.

However, nothing at all is being logged about the Unknown transmission.

The UID is now appearing but not logged.

The LOG is working fine for 'identified' channels that are in the db but the mystery channels [the ones I am interested in] continue to be ignored as from the start.

Can you please post a screenshot? The unknown ids that I have seen on my HP1 are shown as ' TGID: xxxx' not TG: xxxx' like yours.

To make a screenshot click on the VC window then hit ALT + Print Screen on your keyboard. Next open Paint and paste and save as tif or gif.

Tnx for quick reply. I am away for a holiday and can not post the screen shot. but, you are correct. My HP1 is the same as yours.

That is the unknown Talk group has the PREFIX: 'TGID: 1234' [in large Yellow font] and the word 'Unknown' on the line above [in Orange letters].

I am sorry for the confusion, I was working late at night and without my glasses on and not correctly observing the details, a poor way to report problems I know. My apology.

Now that we are agreed on the problem, can you determine a fix?

I made some changes in build 3 , if that does not work we have to ask Uniden to change the way unknown id's are send out to the PC.

I have now downloaded Build 3 and have it running in VC. It does appear to be logging the talk group in the column DATA, TGID: 123 in the column Channel Tag, and the word Unknown in the column called Department.

In other words, at first look, it appears to be working Perfectly! Congratulaions it seems the problem(s) are solved.

Of course, I have to now move to regular operation and see that it logs 'regular traffic' as well!
